Discharge Summary

Patient: Maria Hofmann

Date of Birth: 09/22/1965

Admission Date: 01/15/2024

Discharge Date: 01/24/2024

Attending Physician: Prof. Klaus Richter, MD

Dear Colleagues,

Ms. Maria Hofmann, DOB 09/22/1965, was admitted January 15–24, 2024 to initiate adjuvant chemotherapy. She was diagnosed with breast carcinoma following routine mammography. Core biopsy confirmed invasive ductal carcinoma grade 2, ER-positive, HER2-negative. Staging workup revealed no distant metastases.

Primary Diagnosis: Breast carcinoma (C50.9) — Tumor staging: T2 N1 M0

Relevant laboratory findings on admission:

Parameter	Value	Reference
HbA1c	5.8%	< 6.5%
WBC	6.2 G/L	4.0–10.0 G/L
Hemoglobin	12.1 g/dL	12.0–16.0 g/dL
Creatinine	0.8 mg/dL	0.5–0.9 mg/dL

The first cycle of AC chemotherapy was initiated and well tolerated. The patient was discharged with antiemetic prophylaxis and a follow-up appointment in 3 weeks.

Past medical history: well-controlled hypothyroidism on levothyroxine 75 mcg and a prior appendectomy in 2001. Non-smoker, no relevant allergies.

We recommend close oncological follow-up and repeat laboratory workup prior to the next chemotherapy cycle.

Prof. Klaus Richter, MD

Chief of Hematology and Oncology
